

## Truss Jibs

Truss Jib - A truss jib is utilized to pick up and place trusses. It is actually an extended jib additional part which is outfitted along with a triangular or pyramid shaped frame. Usually, truss jibs are mounted on machinery like a skid steer loader, a compact telehandler or even a forklift using a quick-coupler attachment.

Older style cranes which have deep triangular truss jibs are usually assemble and fastened utilizing bolts and rivets into standard open structural shapes. There are rarely any welds on these kind jibs. Every riveted or bolted joint is susceptible to rust and thus needs frequent upkeep and check up.

Truss jibs are designed with a back-to-back arrangement of lacing members separated by the width of the flange thickness of another structural member. This design could cause narrow separation among the flat surfaces of the lacings. There is little room and limited access to clean and preserve them against rust. A lot of rivets loosen and corrode in their bores and should be replaced.
