

## Forklift Fork Positioner

Forklift Fork Positioner - The fork positioner is a hydraulic device that could allow the person driving to work the forklift without leaving the seat. They are made out of top quality materials and are intended to be able to withstand the most difficult operations and work environments. Side shifting models have the extra ability to be able to laterally position the arms or the entire load so as to facilitate more accurate carrying and placement in a faster and much more effective way.

The blade pocket is quite unique and can enable the operator to securely swing the forks into position without any worry of destroying the positioning cylinders. This could allow the operator the option to perform independent or simultaneous fork movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages can be converted into blade positioners on existing units.
